HOSEIN HAYATI

Backend Engineer | C# · .NET 10 · DDD · CQRS · TDD | Agentic / AI-assisted coding

SUMMARY

Backend engineer building with .NET since 2017. I like owning a system end to end: architecture, data, integrations, deployment and monitoring. As the sole developer I took a high-volume transaction system from a half-finished codebase to production, where it processed 200+ billion Toman in about two years. I work with Clean Architecture, DDD and CQRS, and I ship faster with agentic coding (Claude Code) while keeping architecture, review and production in my own hands.

EXPERIENCE

Senior Backend Developer

Saman Insurance | Jul 2023 – Present

- Sole developer of a high-volume transaction system: 200+ billion Toman processed in ~2 years.
- Append-only transaction log as the single source of truth — every derived value is reconstructable from recorded transactions, not from a cached column.
- Value objects instead of primitives, so invalid operations fail loudly at the domain boundary instead of silently in a report.
- Idempotent handling of third-party callbacks and client retries — duplicate requests have no side effects.
- Concurrency control on hot rows, added after a race condition surfaced in early staging.
- Automated nightly consistency checks, written after one manual investigation took three days.
- Structured logging with Serilog + ELK; monitoring dashboard for the operations team.
- Pattern-based detection of abnormal traffic bursts.
- Third-party integrations built as separate services with explicit failure paths.
- Absorbed 10x growth in volume via query tuning, Redis caching and background jobs.
- Onboarded the six-engineer team that later took the system over, via a documentation sprint covering business rules, deployment and troubleshooting.
- Event-driven microservices (.NET 6, DDD): development and maintenance.
- Legacy ASP.NET MVC / ADO.NET system: new features, custom metrics, Grafana dashboards.

Founder & Sole Engineer

Pishgamit (self-employed) | Apr 2017 – Present

- A technical media platform that I built during my student years and have kept alive ever since.
- Complete design, implementation, and deployment of a news/educational platform based on ASP.NET Core in a production environment with .NET 10.
- Complete Monolithic architecture (MVC) with a comprehensive management dashboard (Blazor) for content management and reporting.
- Rebuilt onto .NET 8 with AI-assisted development, then migrated to .NET 10; day-to-day operations run with Claude.
- Nine years of maintenance taught me more about long-lived systems than any zero-to-one project.

.NET Developer

CONTACT

Location: Tehran, Iran

Phone: +98 921 675 8318

Email: hoseinhayati.ir@gmail.com

Website: hoseinhayati.ir

LinkedIn: linkedin.com/in/hosein-hayati

GitHub: github.com/Hoseinhayati

TECHNICAL SKILLS

Languages & Frameworks:

C#, .NET 10, ASP.NET Core, ASP.NET MVC, Blazor, React

Data:

SQL Server, T-SQL, EF Core, Dapper, MongoDB, Redis, Elasticsearch

Architecture:

Clean Architecture, DDD, CQRS, Event-Driven, Microservices, Design Patterns

Platform:

RabbitMQ, Docker, Serilog + ELK, Grafana, Git, Azure DevOps / TFS, IIS

AI-assisted development:

Claude Code, Cursor, GitHub Copilot

Practices:

Idempotency, concurrency control, consistency checks, observability, third-party integrations

EDUCATION

B.Sc. in Software Engineering

Islamic Azad University, Mahshahr
2013 – 2017

LANGUAGES

Persian: Native

English: Intermediate (Technical reading and writing)

MehrcomTech | Nov 2021 – Jul 2023

- Built and debugged core business modules with a DDD-layered structure, keeping business rules out of controllers and infrastructure.
- EF Core for the write model, Dapper where read performance mattered — a deliberate split rather than one ORM everywhere.
- Integrated external services via Flurl, with retry and failure handling around calls we did not control.

Full-Stack Web Developer

Saipa | Oct 2020 – Oct 2021

- Rebuilt legacy Oracle Forms workflows as an ASP.NET Core + React application used by internal operations teams.
- Delivered the full slice — API, data access, UI (Kendo UI) and reporting (Stimulsoft) — rather than a single layer.

SELECTED PROJECT (AGENTIC CODING)

LifeBudget: web + Android budgeting app (personal project)

- Logs spending from bank SMS and tracks instalment credit; no foreign dependencies. ASP.NET Core, Kotlin.
