HOSEIN HAYATI

Senior .NET Backend Engineer | Wallets, Ledgers & Insurance Core Systems

SUMMARY

I work on systems where mistakes are expensive. Seven years on wallets, ledgers and insurance platforms where a rounding error is a real person's real money. As the sole developer, I took a digital wallet from a half-finished codebase to production, where it processed 200+ billion Toman in roughly two years. I work with Clean Architecture, DDD and CQRS because in practice they keep the cost of change low.

EXPERIENCE

Senior Backend Developer

Saman Insurance | Jul 2023 – Present

- Sole owner of the company's digital wallet — 200+ billion Toman processed in ~2 years.
- Ledger as the single source of truth — every balance a user sees is reconstructable from recorded transactions, not from a cached column.
- Money as a value object (amount + currency + rules) instead of a bare decimal, so cross-currency and negative-amount errors fail loudly at the domain boundary.
- Idempotency across payment-gateway callbacks and user retries — duplicate callbacks and double-clicks no longer create duplicate money.
- Concurrency control on balance mutation, eliminating a race condition that duplicated funds in early staging.
- Automated nightly reconciliation, written after one manual mismatch investigation cost three days.
- Structured logging with Serilog + ELK; transaction monitoring dashboard for the operations team.
- Pattern-based detection for abnormal transaction bursts.
- Two wallet types (credit and cash) with independent business rules; gateway deposits, referral credit, withdrawal, P2P transfer.
- Payment-gateway integration built as a separate service with explicit failure paths.
- Absorbed 10x growth in transaction volume via query tuning, Redis caching and background jobs.
- Onboarded the six-engineer team that later took the system over, via a documentation sprint covering business rules, deployment and troubleshooting.
- Gold Unit-Link — event-driven microservices (.NET 6, DDD).
- Darmanat — ASP.NET MVC / ADO.NET: new features, custom metrics, Grafana dashboards.

Founder & Sole Engineer

Pishgamit (self-employed) | Apr 2017 – Present

- A technical media platform that I built during my student years and have kept alive ever since.
- Complete design, implementation, and deployment of a news/educational platform based on ASP.NET Core in a production environment with .NET 10.
- Complete Monolithic architecture (MVC) with a comprehensive management dashboard (Blazor) for content management and reporting.
- Nine years of maintenance taught me more about long-lived systems than any zero-to-one project.

.NET Developer

CONTACT

Location: Tehran, Iran

Phone: +98 921 675 8318

Email: hoseinhayati.ir@gmail.com

Website: hoseinhayati.ir

LinkedIn: linkedin.com/in/hosein-hayati

GitHub: github.com/Hoseinhayati

TECHNICAL SKILLS

Languages & Frameworks:

C#, .NET 8, ASP.NET Core, ASP.NET MVC, Blazor, React

Data:

SQL Server, T-SQL, EF Core, Dapper, MongoDB, Redis, Elasticsearch

Architecture:

Clean Architecture, DDD, CQRS, Event-Driven, Microservices, Design Patterns

Platform:

RabbitMQ, Docker, Serilog + ELK, Grafana, Git, Azure DevOps / TFS, IIS

Domain:

Ledger design, reconciliation, idempotency, payment-gateway integration, insurance issuance

EDUCATION

B.Sc. in Software Engineering

Islamic Azad University, Mahshahr
2013 – 2017

LANGUAGES

Persian: Native

English: Intermediate (Technical reading and writing)

MehrcomTech | Nov 2021 – Jul 2023

- Built and debugged core banking modules with a DDD-layered structure, keeping business rules out of controllers and infrastructure.
- EF Core for the write model, Dapper where read performance mattered — a deliberate split rather than one ORM everywhere.
- Integrated external banking services via Flurl, with retry and failure handling around calls we did not control.

Full-Stack Web Developer

Saipa | Oct 2020 – Oct 2021

- Rebuilt legacy Oracle Forms workflows as an ASP.NET Core + React application used by internal operations teams.
- Delivered the full slice — API, data access, UI (Kendo UI) and reporting (Stimulsoft) — rather than a single layer.
